Les Companions

Robots for painters!

The world of construction and finishing works is an ultra-competitive sector where it is sometimes difficult to exist and stand out. All the players have to face daily challenges of margins, safety and hard work conditions.

We believe that the association of our robotics system and the operational excellence of your Companions is the key to success and peace of mind. PACO's mission is to perform the most tedious or low-experience-demanding tasks, to create a safe and cost-effective working environment which promotes the knowledge of each worker on the construction site.

Our ambition is to accompany you on a daily basis on your building sites for sanding and painting work. This human-machine collaboration allows you to anticipate your needs, thanks to a direct follow-up of the building site. PACO is an assistance and support solution which releases you from your constraints

- 1 - The quantity surveyor or painter receives and analyses the building site in the traditional way.
- 2 - It performs a complete and accurate measurement by performing a 3D scan of its working environment.
- 3 - The painter or quantity surveyor programs PACO and defines all the work to be carried out (painting, sanding, etc.).
- 4 - The painter collaborates with PACO. The robot carries out the ungrateful tasks in an automated way. The painter concentrates on the more noble tasks with higher added value: fine work, analysis and decision making.
